

Instructions Envelope

In this GREEN envelope, you'll find all the information you need to recover and use the Bitcoin safe that the vault owner left to the heirs.

Items list :

- Vault Description
- Recovery Packages Distribution
- Items description
- Wallet Regeneration Flowchart
- Transaction Signing Flowchart
- Guide 1: Regenerating the Vault with the Wallet Descriptor
- Guide 2: Regenerating the Wallet Descriptor with the Public

Keys

- Guide 3: Spending from the Vault

Before carrying out any transactions or interacting with the safe, please take the time to understand how the various elements of the Bitcoin vault work and what instructions you need to follow to ensure its security.

WARNING:

The configuration of the Bitcoin vault may seem old and outdated when you try to access it. Today's tools, devices and applications are probably quite different from those I propose to use in these instructions.

Nevertheless, the safe remains ultra-secure. As long as the various packages in the safe have been guarded and protected to this day, you can continue to use the safe to store bitcoin.

There is no urgent need to remove funds from the safe. The most important thing is to follow these instructions:

NEVER share the Seeds and Passphrase, which are highly-confidential information, with anyone other than the owner and the heirs. ALWAYS keep the Seeds and the Passphrase disconnected from the internet and offline.
