Wallet Descriptor Envelope

In this ORANGE envelope, you will find the Wallet Descriptor, which allows you to regenerate the Bitcoin Wallet in the Wallet Management Interface.

Items list:
- Wallet Descriptor in QR format
- Wallet Descriptor in text format (same page)

The 2 items represent the same information (Wallet Descriptor) in 2 different formats.

The Wallet Descriptor is the backup of all the Public Keys, derived from the 5 Signing Keys (combination of Seeds and Passphrase.)

Whereas the Seeds and the Passphrase must ALWAYS remain offline and disconnected from the internet, the Wallet Descriptor must be exported to an internet-connected device in order to get information about the Bitcoin vault, such as receiving addresses, transactions, balance, etc.

Highly-confidential data: Seeds and Passphrase
Semi-public data: Wallet Descriptor

WARNING:

Although the Wallet Descriptor is not highly-confidential information, sharing it does present a privacy risk.

Anyone who has access to the Wallet Descriptor will have access to information on the contents of the Bitcoin vault (transactions, amounts, total balance, etc.).

As a general rule, only share the Wallet Descriptor with the owner, the guardians, and the heirs.

The Wallet Descriptor is essential for sending and receiving transactions to and from the Bitcoin vault. If lost, it can be recreated from the 5 Signing Keys.
